

Aaron (Ron) Mishiyev

Senior Software Engineer | Distributed Systems, Payments, AWS Serverless

ronmshv@gmail.com | github.com/rondigital1 | 786-999-5414 | Miami, FL | linkedin.com/in/ron-mishiyev

Summary

Senior Software Engineer with 8+ years building backend and distributed systems across fintech, secure messaging, and AI product work. Led Node.js/AWS event-driven systems processing 2.5M+ jobs/day and 400K+ real-time messages/day; owned regulated payment, ledger, reimbursement, refund, ACH, wire, and internal transfer workflows. Currently building full-stack AI products with TypeScript, React/Next.js, Node.js, PostgreSQL, LangChain, and LangGraph.

Technical Skills

- **Programming Languages:** TypeScript, JavaScript(ES6+), SQL, Ruby
- **Backend:** Node.js, NestJS, Express.js, REST APIs, webhooks, background jobs, payment workflows, ledger/reconciliation systems
- **AI / LLM:** AI-Assisted Development (ClaudeCode, Codex, Cursor), LangChain, LangGraph, LLM orchestration, tool/function calling, structured outputs, context design, agentic workflows
- **Architecture:** Distributed Systems, Microservices, Event-Driven Architecture, Serverless, Workflow Orchestration
- **Cloud / Distributed Systems:** AWS Lambda, SQS, SNS, EventBridge, API Gateway, RDS, DynamoDB, S3, CDK, CloudFormation, serverless architecture, event-driven systems, microservices
- **Data:** PostgreSQL, MySQL, DynamoDB, Prisma ORM, MongoDB
- **Frontend:** React, Next.js
- **Testing / Observability / Delivery:** Vitest, Jest,nock, Datadog, CloudWatch, Docker, CodePipeline, CI/CD
- **Languages:** English(native), Hebrew(native), Spanish(professional), Russian(conversational)

Professional Experience

Self-Employed

(November 2025 to Present)

Independent AI-Native Software Engineer

Remote

- Built three 0→1 full-stack AI product prototypes using TypeScript, Next.js, Node.js, PostgreSQL, LangChain, and LangGraph; owned product scope, architecture, data modeling, backend APIs, and frontend implementation.
- Designed and built AtlasGraph, an AI travel-planning application that captures structured user preferences, orchestrates multi-step itinerary generation, and supports revision workflows with persisted planning context.
- Built ConceptVault, a LangGraph-based research distillation system that coordinates web research, content curation, concept extraction, and flashcard generation with structured outputs.

Forma Inc.

(July 2023 to March 2025)

Senior Software Engineer

Remote

- Owned backend services for ACH, wire, and internal book transfers across regulated fintech products, improving correctness, reconciliation, and failure handling for business-critical fund-movement workflows.
- Led end-to-end redesign of refund workflows after uncovering production failure modes; authored the design doc, drove emergency remediation, and defined long-term architecture to prevent missing, unapplied, and mismatched funds.
- Recovered \$40K+ in orphaned customer funds within one week by investigating three refund failure scenarios, reconciling impacted accounts with SQL/Prisma, and correcting API/state mismatches.
- Re-architected refund matching and reconciliation logic, reducing refund exceptions by ~90% and improving auditability of high-risk payment flows.
- Built ledger and transaction APIs for HSA, LSA, and FSA reimbursement/payment workflows; optimized Prisma/PostgreSQL queries and expanded Vitest/Jest/nock coverage across critical financial paths.

- Mentored engineers through architecture reviews and production debugging; supported on-call incident triage for payment and ledger systems.

Springbig Inc.**(November 2019 to December 2022)***Senior Software Engineer*

Boca Raton, FL

- Led migration of a business-critical Rails monolith to an event-driven Node.js microservices architecture on AWS Lambda and SQS, scaling to 2.5M+ jobs/day and 400K+ real-time messages/day.
- Decomposed the monolith into four single-responsibility Lambda services decoupled via SQS, isolating failures and enabling independent scaling per service.
- Tuned Lambda concurrency and implemented parallel SQS/DynamoDB batching, eliminating delivery lag and reducing infrastructure costs.
- Owned observability for critical services through CloudWatch dashboards and proactive SNS alerting, achieving a zero-DLQ steady state.
- Implemented Infrastructure as Code with AWS CDK and built CI/CD pipelines with CodePipeline, enabling canary-style rollouts with automated testing and approval gates.

Wickr (Acquired by AWS)**(August 2017 to August 2019)***Software Engineer*

New York, NY

- Built asynchronous Node.js chatbot services for a secure messaging platform, integrating with Google Calendar, Zendesk, Uber, and other third-party APIs.
- Designed a modular bot framework that enabled internal teams to build, deploy, and manage chatbots using shared primitives and standardized orchestration patterns.
- Implemented a Node.js native add-on for the C++ SDK, exposing core messaging capabilities to JavaScript applications.
- Built REST APIs, Dockerized bot services, and authored setup documentation to reduce onboarding friction for internal developers.

Education**Binghamton University SUNY***Bachelor of Arts in Mathematics***2017****Brooklyn College CUNY***Bachelor of Science in Computer Science***2018**
